

#1026 Electrified Mini Hinge

The 1026 Electrified Mini Hinge is a compact power-transfer solution designed to route low-voltage wiring through the hinge side of a door opening without interfering with smooth door operation. Its 1.5 inch long, tamper-resistant and weather-resistant design helps maintain a fluid door swing while distributing stress along the full height of the door. Built with 26-gauge wiring, the 1026 includes a standard six-wire configuration with an optional eight-wire version for additional electrified hardware requirements. The hinge can also be removed without re-hanging the door, helping simplify service and maintenance for access-control, security, and electrified opening applications. Available in clear anodized aluminum or dark bronze anodized aluminum finishes.

Product Specification:

The 1026 Electrified Mini Hinge provides reliable power transfer through the hinge side of the opening while supporting a smooth door swing and simplified service access

- Electrified mini hinge with Power Transfer Technology
- Maintains a fluid door swing while evenly distributing stress along the full height of the door
- Removable without the need to re-hang the door
- 26-gauge wire construction
- 6-wire standard configuration
- 8-wire configuration available as an option
- Tamper-resistant design
- Weather-resistant construction
- 1.5 inch length
- Available in clear anodized aluminum or dark bronze anodized aluminum

Available Finishes

CA: Clear Anodized

DB: Dark Bronze
